Couplers for OO9.

NZFinescale supplies a wide range of detail parts and kits for a variety of prototypes and scales. S scale chopper couplers were one of our first products over 25 years ago and these continue to give good service. Our OO9 couplers arose from a generously shared customer's project.

Options for OO9:

- 1. NZR style. Actually S scale but 4.4mm diameter face is acceptable to some. Plain boss for screw mount.
- 2. NZR style. As per (1) but with a mount that fits a Kadee #5 draughtbox.
- 3. True scale 4mm couplers based on drawings from Ffestiniog of those fitted to L&B replica 'Lyn'. Plain boss supplied with a 3D printed mounting suitable for PECO wagons as well as other applications. (6mm height to coupler centreline)
- 4. As (3), but fitted with NEM mounting.
- 5. Custom couplers to suit your prototype. These are more cost effective than you might expect. Please ask.

Things to consider.

Standards: Reliability is excellent on good track and with consistent mounting. Scale couplers may not be quite as easy to use as 'toy' couplers but they will look far better.

Sideplay: The NEM mount does not allow sideplay. The only sideplay is due to slack in the hook/slot, or swing in the truck/bogie if the mount is thereon. Experience suggests that sideplay with headstock mounting is adequate, but is not recommended for tight radius curves. If in doubt use a boss style mount.

Finishing castings: Couplers are supplied as raw brass castings as shown in the attached pictures. They need to be cut from sprues, finished with files/abrasives and may require careful straightening. Holes may need finishing. Colouring with metal blackening compounds is robust and convenient.

Centring: NEM mount couplers are aligned by the mounting. Kadee mount couplers use the spring supplied in the draughtbox to centre. Couplers supplied with a plain boss can be aligned using pairs of small magnets (1mm dia x 0.5mm, not supplied) fitted to a cast recess in the coupler boss and the wagon underframe. The 3D printed draughtbox has a recess for a

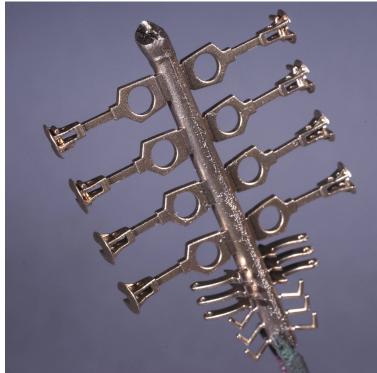

centring magnet. The NZR style boss has the magnet recess, but magnet mounting on the underframe needs to be arranged by the user.

Inter-operability: The geometry of the two head/hook styles is similar, but there has been no effort to make these interchangeable. They may couple, and can likely be made to do so with a little fettling, but mixing types is NOT recommended. Mounting method will not affect interoperability provided coupler centrelines are consistent.

Supply to UK and elsewhere: We supply items to customers worldwide. Please note that import requirements and any charges vary and are the responsibility of the purchaser.
